

Developing a Success Proposal for Encoding a Script in Unicode

Internationalization and Unicode Conference #42
11 September 2018

Anshuman Pandey
Script Encoding Initiative, UC-Berkeley

About me

- Product Strategist, Avant, Chicago
 - Fin-tech analytics
- Researcher, Script Encoding Initiative, UC-Berkeley
 - Develop Unicode standards for writing systems of the world
- Education
 - Post-Doctoral Researcher (Linguistics), UC-Berkeley, USA
 - PhD (History), University of Michigan, Ann Arbor, USA

About me: Unicode

- Developed encodings for
 - 24 scripts
 - 4 number systems
 - various individual characters
- Work in progress
 - 25 script proposals
 - research on 100+ scripts

About me: Unicode

Why?: Enable Digital Humanities Foundations

- Representation of ‘visible language’, eg. script / writing system
 - Often ignored in traditional and applied linguistics and language studies
 - Key to access and presentation of textual sources in the original
- Display and input of language (keyboard, stylus, etc.)
 - Enable users to input, search, and view text uniformly on devices
- Natural language processing (NLP) and machine learning (ML)
 - Information extraction and analysis using programmatic methods
- Goal: all languages as digitally native as English

'Full Stack' Digital Support for Languages

- Character-encoding standard
- Locale data
- Font / typeface
- Keyboard / input methods
- Text layout and formatting
- Database support
- System and browser support
- NLP tools and algorithms

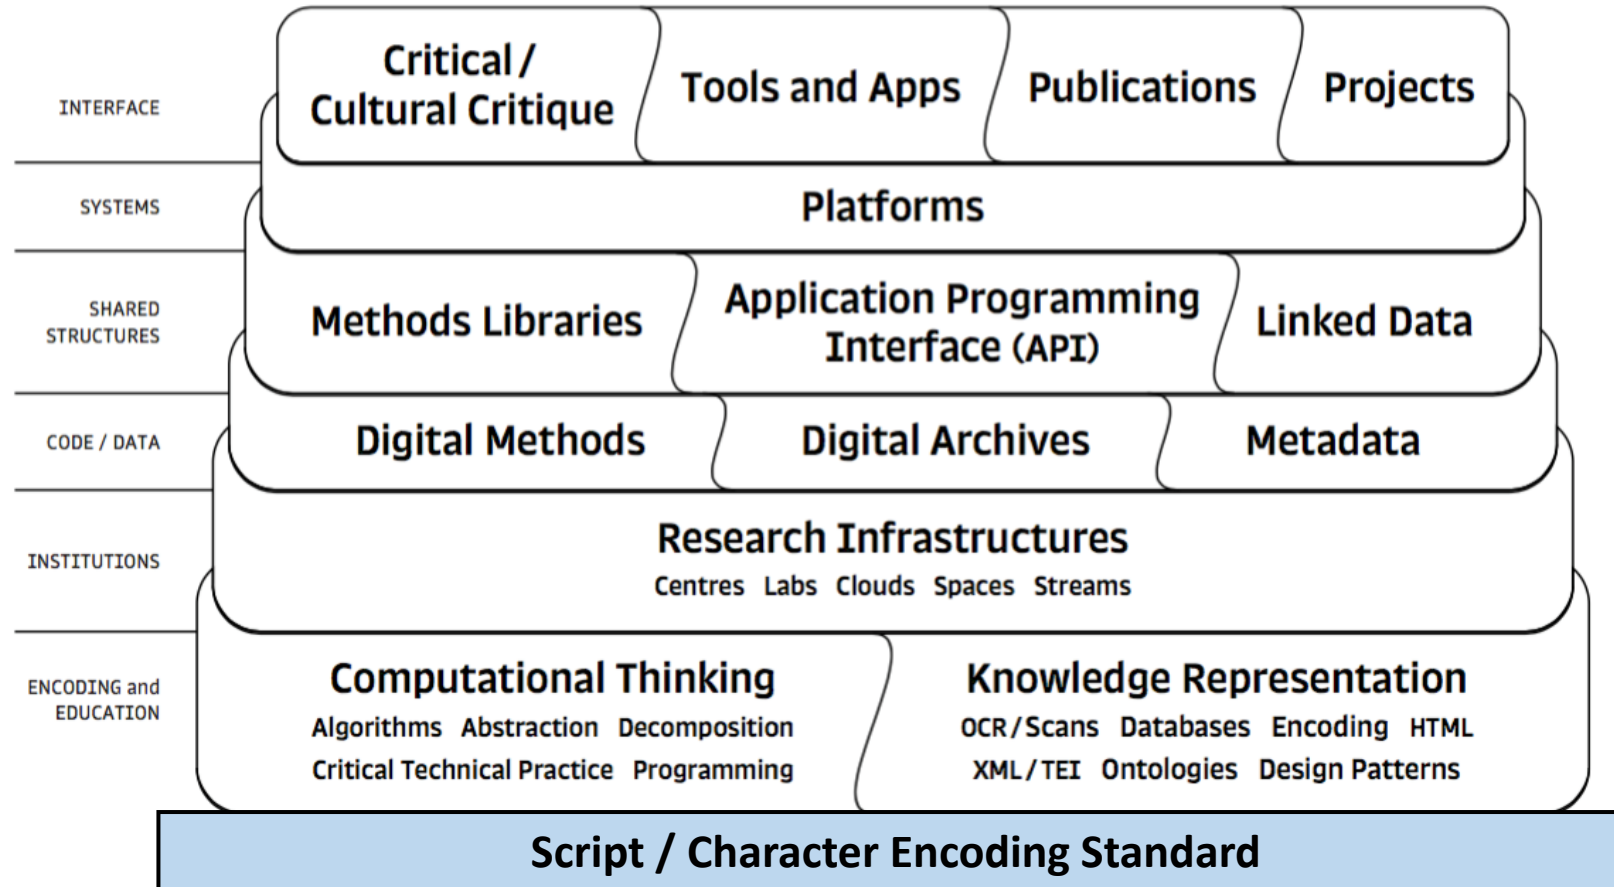

'Full Stack' Digital Support for Languages

Script Encoding in the DH Stack

Script Encoding Process

Script Encoding Process: Overview

1. **Identification:** Native users, scholars, others identify a script not yet encoded in Unicode
2. **Development:** Research script and develop script proposal
3. **Review:** Unicode Technical Committee reviews proposals; may request changes; vote to approve or disapprove
4. **Publication:** Publication of script in Unicode standard
5. **Implementation:** Create fonts, keyboards, update software (Noto project; individuals)
6. **Iterative development:** Repeat for new character additions

Script Encoding Process: Focus

- 1. Identification:** Identify a script not yet encoded in Unicode
- 2. Development:** Techniques for researching scripts and models

Script Encoding Process

Identification

Script Encoding Process: Identification

- Existing character-encoding standards
- Request from a native user community
- Proposal from scholarly user community
- Submission from writing-systems researchers and enthusiasts
- Fieldwork and archival research

Identifying a script

Case Study: Old Sogdian

- Consonantal alphabet
- Used for writing Sogdian
 - now-extinct eastern Iranian language
- Derived from Imperial Aramaic
 - Variation of Achaemenid administrative script
- In use from 3rd – 7th century CE

Old Sogdian: Identification

- Known to scholars
 - 19th century to present
 - active scholarship, publication trends
- Digital humanities content
 - TITUS project: transliterations
 - UW Silk Road Project: translations
- Manuscript digitization
 - International Dunhuang Project (IDP)

Old Sogdian: Identification

Sogdian Ancient Letter No. 3

[*Verso*] From (his) daughter Shayn to the noble lord Nanai-dhat.

[*On another part of the verso*] From (his) servant [*left unfinished*].

[*Recto*] To (my) noble lord (and) husband Nanai-dhat, blessing (and) homage on bended knee, as is offered to the gods. And (it would be) a good day for him who might see you healthy, happy (and) free from illness, together with everyone; and, sir, when I hear (news of) your (good) health, I consider myself immortal!

Behold, I am living ..., badly, not well, wretchedly, and I consider myself dead. Again and again I send you a letter, (but) I do not receive a (single) letter from you, and I have become without hope towards you. My misfortune is this, (that) I have been in Dunhuang for three years thanks(?) to you, and there was a way out a first, a second, even a fifth time, (but) he(!) refused to bring me out. I requested the leaders that support (should be given) to Farnkhund for me, so that he may take me to (my) husband and I would not be stuck in Dunhuang, (for) Farnkhund says: I am not Nanai-dhat's servant, nor do I hold his capital. I also requested thus: If he refuses to take me to (my) husband, then ... such support for me that he may take me to (my) mother. The leaders say: Here in Dunhuang there is no other relative closer than Artivan, (but) Artivan [say]: Farnkhund ... whatever ... to do for you. If(?) I(?) (had) no guarantee, no protection, my father ... I have become ... not ... How much more would I have ... by my father if ... a servant of the Chinese! A free man ... who found ... and ... keeps (his) clothing in good condition(?). And you write (your) bidding to me about everything in ... so that I should ... you and I should know how to think, and if I do not ... you, then you write to me so that I should know how to serve the Chinese. In my paternal abode I did not have such a restricted ... as with(?) you. I obeyed your command (lit. took your command upon my head) and came to Dunhuang and I did not observe (my) mother's bidding nor (my) brothers'. Surely(?) the gods were angry with me on the day when I did your bidding! I would rather be a dog's or a pig's wife than yours! And for me ...

Sent by (your) servant Miwnay. This letter was written in the third month on the tenth day.

[*Added in the margin*] From (his) daughter Shayn to the noble lord Nanai-dhat, blessing (and) homage. And (it would be) a good [day] for him [who] might see [you] healthy, rested (and) happy. ... I have become ... and I watch over a flock of domestic animals. Differently to you, I had a ..., and ... went out. I am ... and I know that you do not lack twenty staters(?) to send. It is necessary to consider the whole (matter). Farnkhund has run away; the Chinese seek him but do not find him. Because of Farnkhund's debts we have become the servants of the Chinese, I together with (my) mother.

Sogdian script

In the Sogdian script used in the “Ancient Letters” (TABLE 48.2), most of the letters are distinct and do not change shape when joined. In the “formal” and “Uyghur” Sogdian scripts, most of the letters are joined and, owing to the use of a broad pen, are frequently difficult to distinguish. In the earlier form, ʾ is still distinguished from n; but in the later, ʾ = n, ʾn = nʾ. Some scribes distinguish z from n by not connecting z to the preceding letter, but others make no distinction. In the later, increasingly cursive, form, other letters tend to become indistinguishable as well: γ/x/s/š, r/β/y. Some letters are distinguished only in final position (by some scribes), e.g., n ~ z, x ~ γ.

z is sometimes distinguished from n or z from ž by a diacritical point ʿ, and the foreign sound b was noted as 𐰁 𐰆.

Old Sogdian: Mistaken identity

Handwritten text in Old Sogdian script, likely a fragment of a larger document. The script is cursive and written on aged, yellowish paper with irregular edges. The text is arranged in approximately 15 horizontal lines, though some characters are partially obscured or cut off at the edges of the fragment. The script is a form of the Sogdian language, which was used in Central Asia during the Sassanid and early Islamic periods.

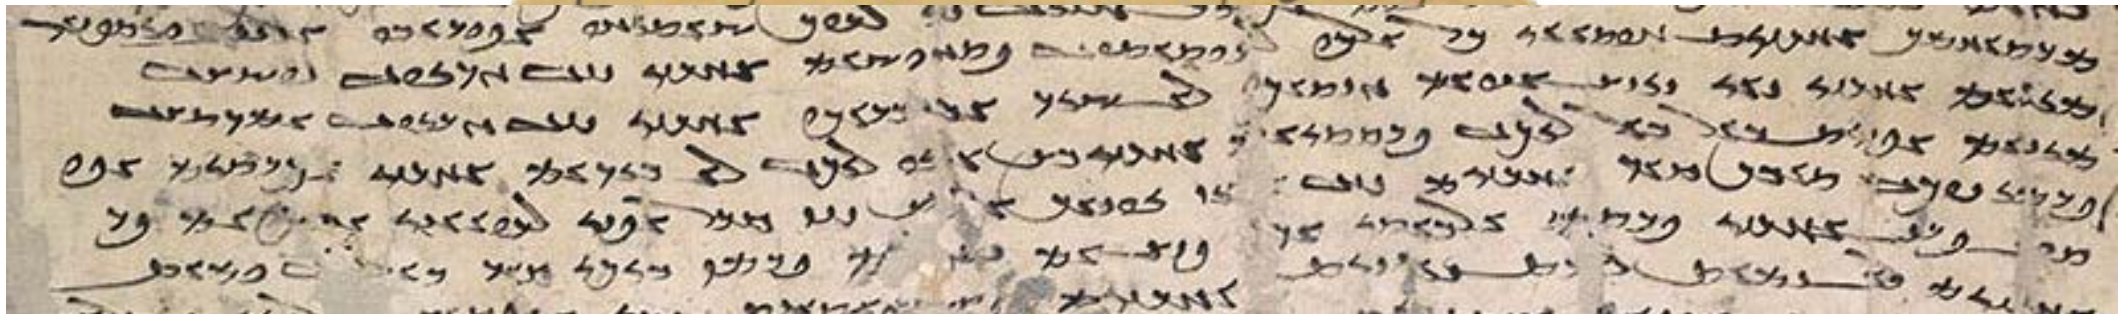

Old Sogdian: Mistaken identity

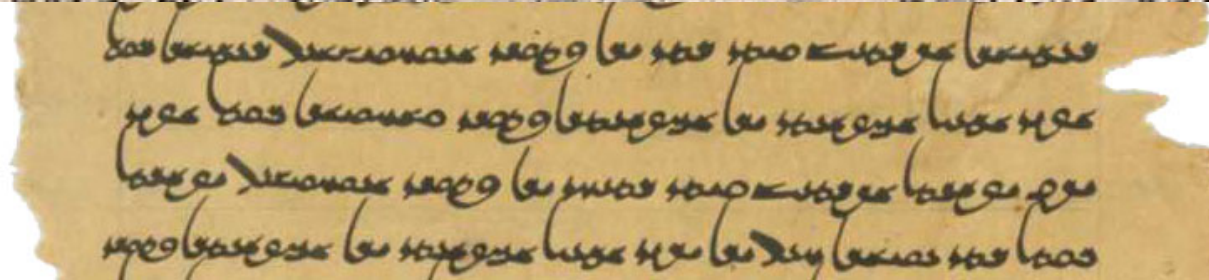

Fragment of an ancient manuscript showing five lines of Old Sogdian script. The script is written in a cursive style on a piece of aged, yellowish parchment.

Sogdian

Old Sogdian

A larger fragment of an ancient manuscript showing multiple lines of Old Sogdian script. The script is written in a cursive style on a piece of aged, yellowish parchment.

Fragment of an ancient manuscript showing four lines of Old Sogdian script. The script is written in a cursive style on a piece of aged, yellowish parchment.

Old Sogdian: Unicode Status

14 Aramaic forms a rather complex family of scripts, with a number of descendants. Certainly there is a basic Aramaic, but it has many descendents (including Mongolian and possibly Brahmi) which are unique enough to merit their own encoding (see table 5.5). More research is required. However, Aramaic is expected to encompass at least:

- Aramaic proper*
- Middle Persian*
- Parthian*
- Sogdian*

Everson, “Roadmapping early Semitic scripts”, 2001.

8 Old North Arabic (see table 5.6), which encompasses:

- Dedanite*
- Lihyanite*
- Thamudic*
- Safaitic*

A cuneiform script:

9 Ugaritic

Northern Linear scripts:

10 Nabataean (see table 5.5)

11 Palmyrene (see table 5.5)

12 Hatran/Armazi (used in Armenia and Georgia)

13 Elymaic

14 Aramaic forms a rather complex family of scripts, with a number of descendants. Certainly there is a basic Aramaic, but it has many descendents (including Mongolian and possibly Brahmi) which are unique enough to merit their own encoding (see table 5.5). More research is required. However, Aramaic is expected to encompass at least:

- Aramaic proper*
- Middle Persian*
- Parthian*
- Sogdian*

Edessan is likely to be either Aramaic or Syriac. More research is required.

15 Phoenician is the catch-all for the largest group of related scripts including its ancestors, Proto-Sinaitic/Proto-Canaanite. Looking at tables 5.1, 5.3, and 5.4 (below) most of the scripts are so similar that there doesn't seem to be any point in trying to encode them separately.

Script Encoding Process: Research

- Analysis of sources to document repertoire and script grammar
- Compare grammar and orthography of related scripts
- Outreach to user community to understand current usage

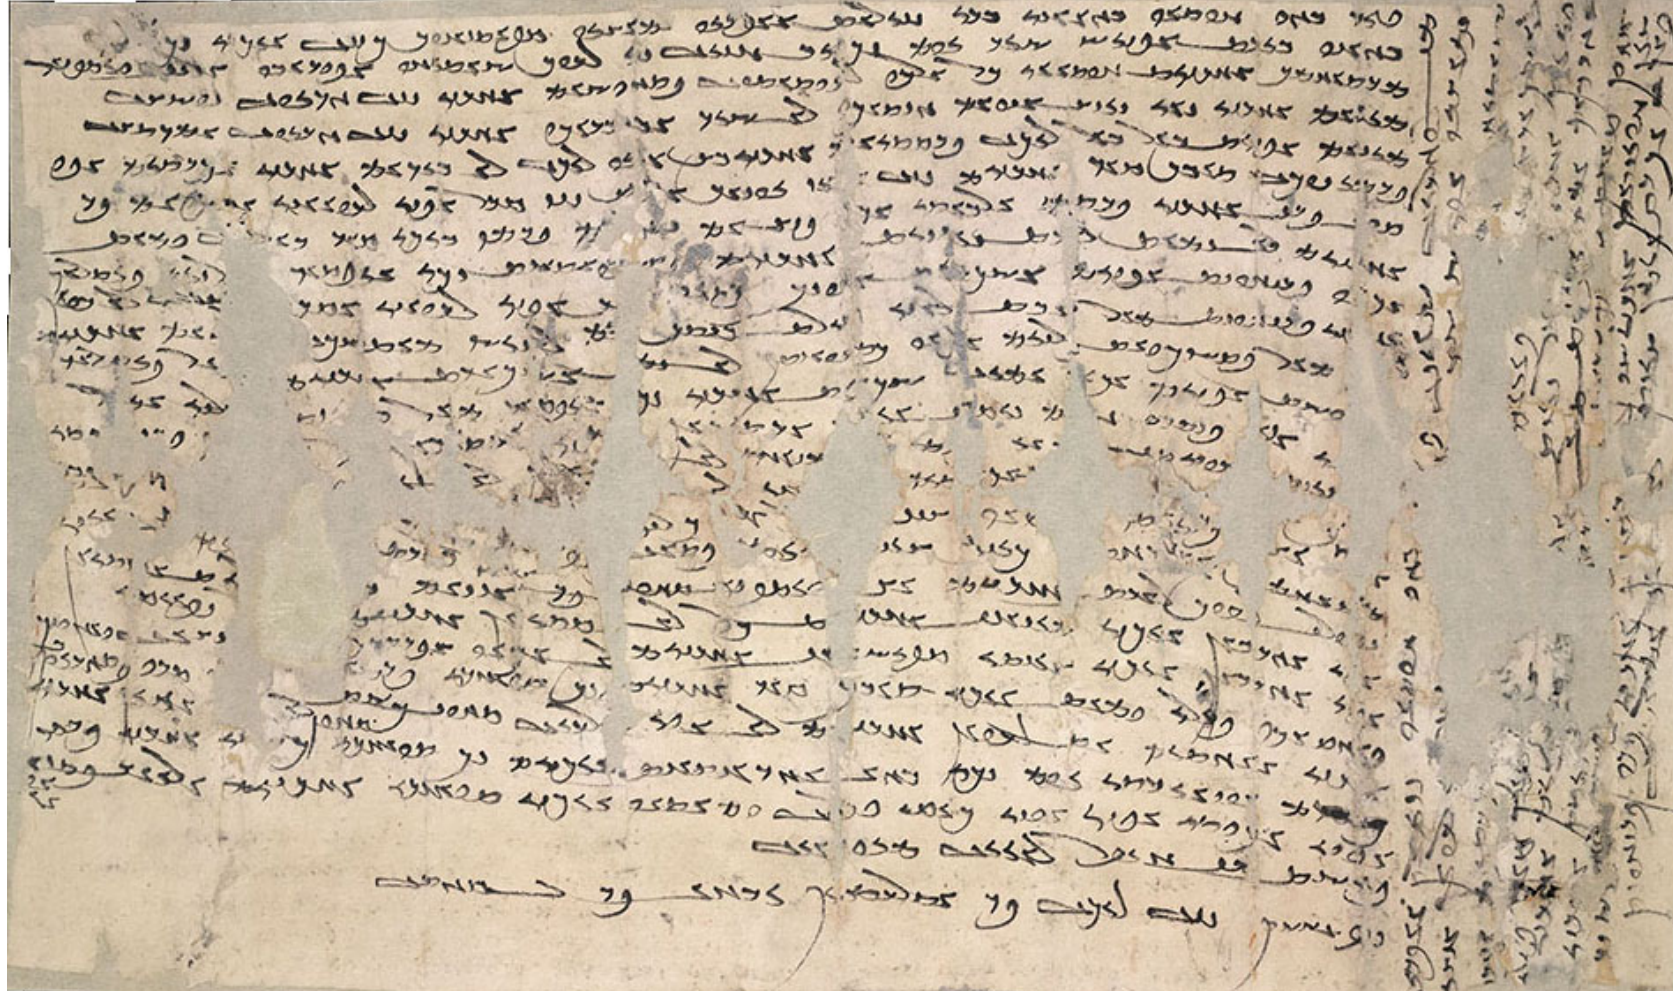

Sogdian sources

- Kultobe: the oldest Sogdian records are stone inscriptions found at Kultobe in modern Kazakhstan
- ‘Ancient Letters’: the earliest attested Sogdian manuscripts are known as the ‘Ancient Letters’ (c.312 CE). These paper documents were found in 1907 by Aurel Stein in Dunhuang, western China
- ‘Upper Indus Graffiti’: appears on more than 600 rock carvings at Shatial and other sites in the Gilgit region of Pakistan (4th-7th c. CE)

Script Encoding Process: 'Script'

Define the 'script':

- Identify repertoire of distinctive signs and variants
- Establish representative glyphs
- Generate script grammar
- Develop encoding model
 - convert conventions for 'writing' into 'typing'
 - translate qualitative data into technical metadata

Script Encoding Process: 'Script'

Latin script for English: Distinctive signs

Not-plain text

Plain text

Script Encoding Process: ‘Script’

- Is the ‘script’ a distinctive system or a stylistic variant?
- Character-glyph model:
 - encodes a ‘normative’ or representation form for a sign as a ‘character’
 - defines other forms as ‘glyphic’ variants
 - plain text vs. not-plain text / ‘rich text’ (font selection)
- “Unicode encodes characters, not glyphs”

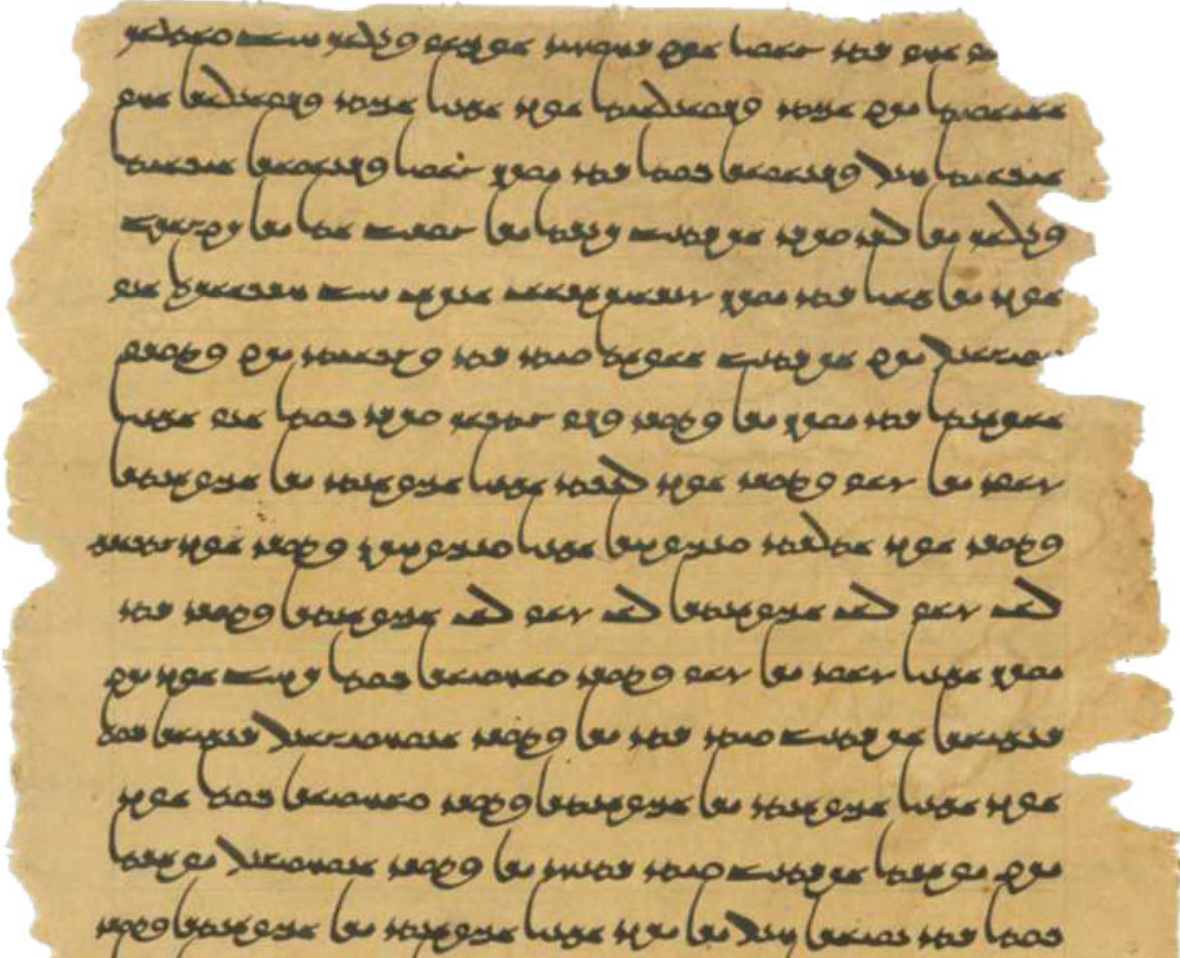

Script Encoding Process: 'Script'

- A script may have historical, scribal, and stylistic variants
- Considerable differences may exist between early and late forms
 - Old Sogdian and Sogdian
- Script boundaries unclear
 - Form of script in early phase may resemble an ancestor
 - Late form of script may resemble a descendant
- Graphically similar scripts may have structural differences

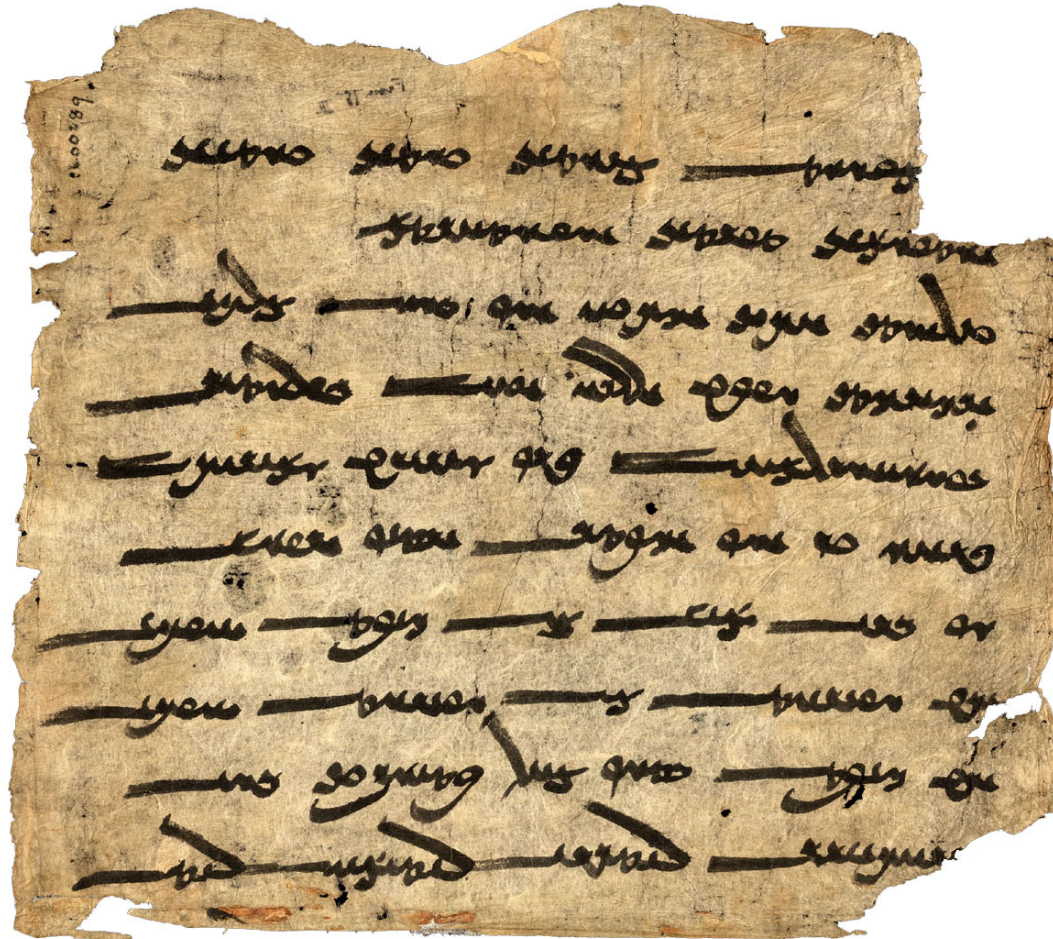

Developmental 'Variant': Vertical Old Sogdian

Developmental 'Variant': Formal Sogdian

Developmental 'Variant'?: Cursive Sogdian

'Script' or 'Variant'?: Chorasmian

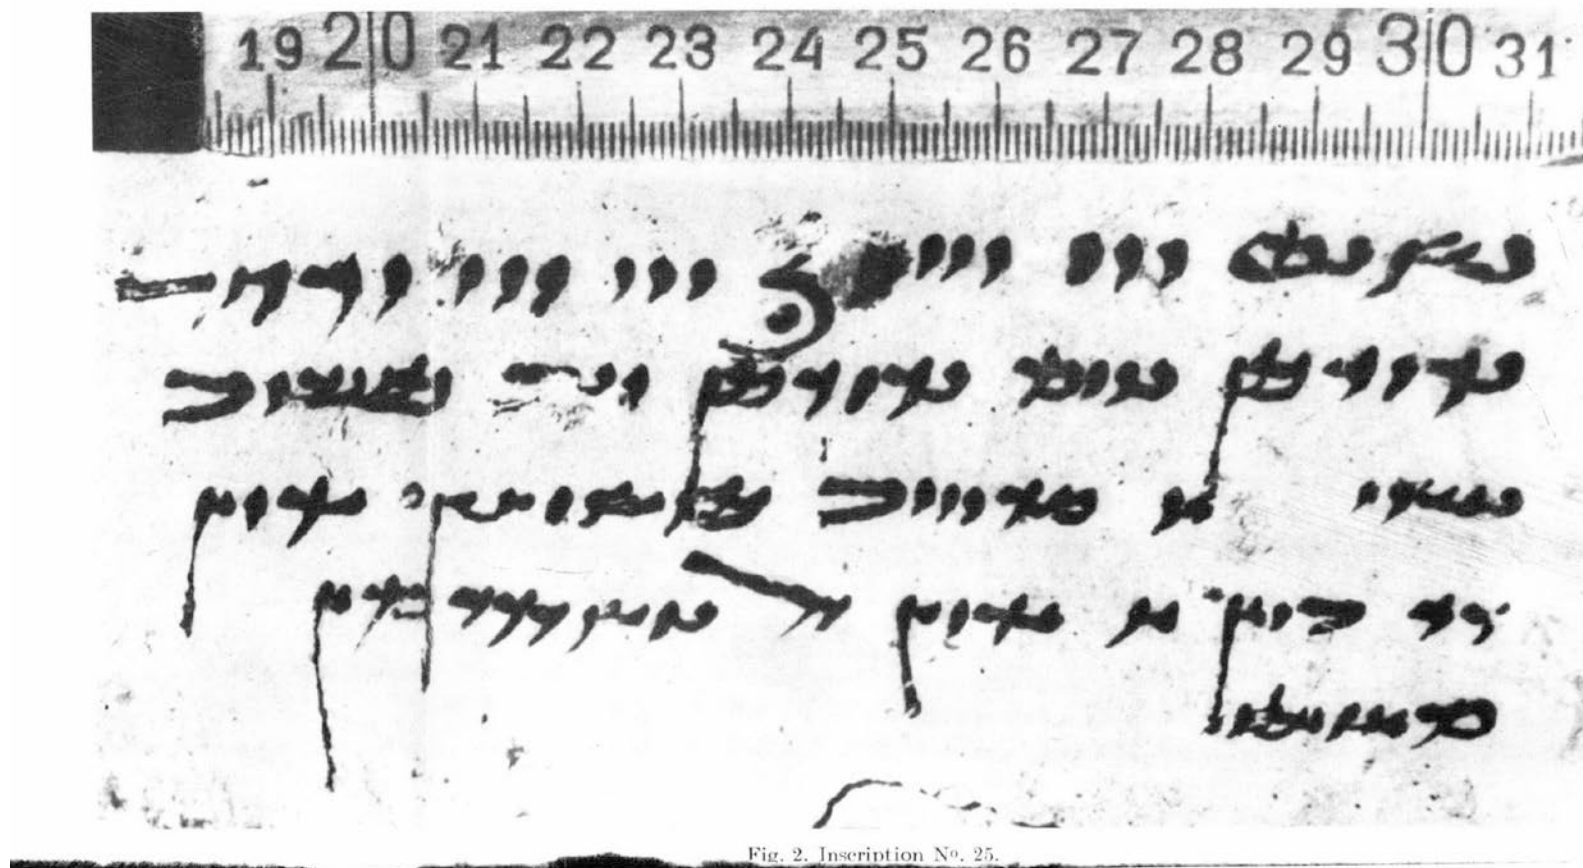

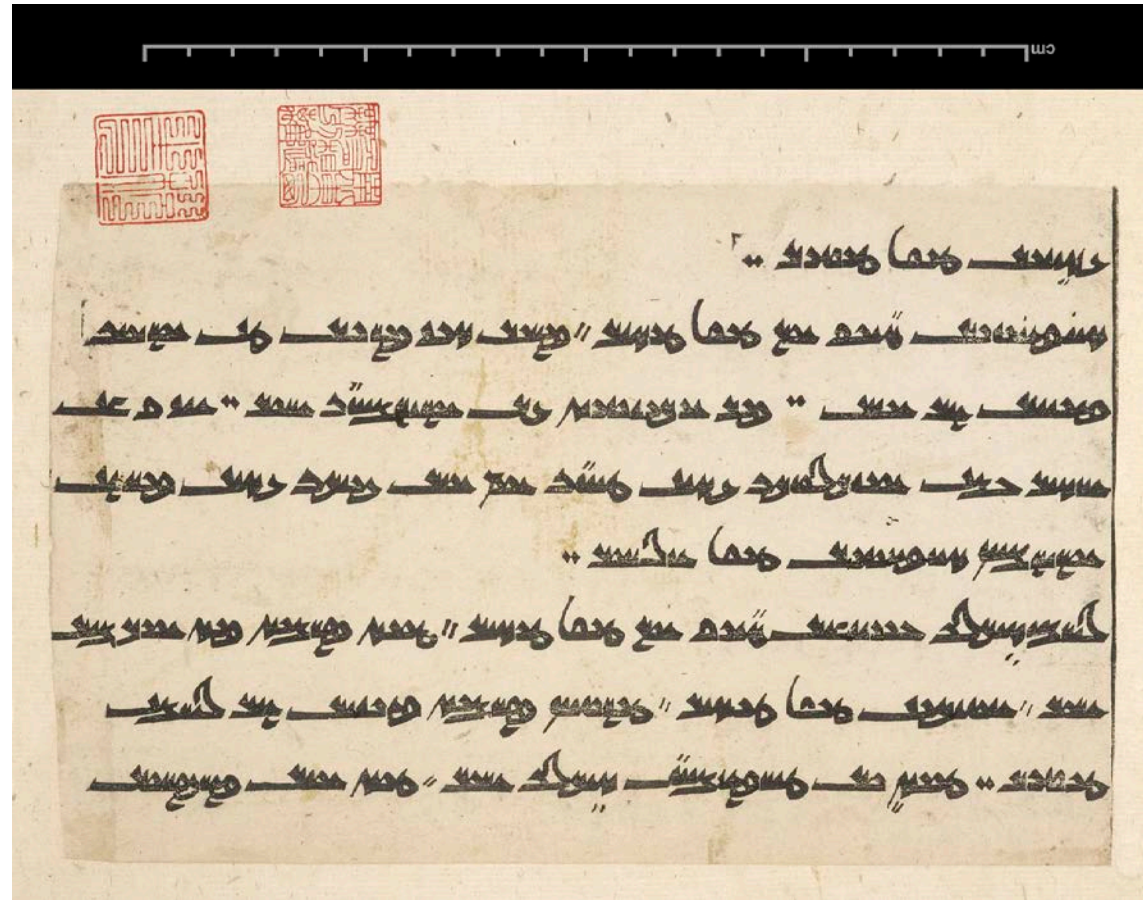

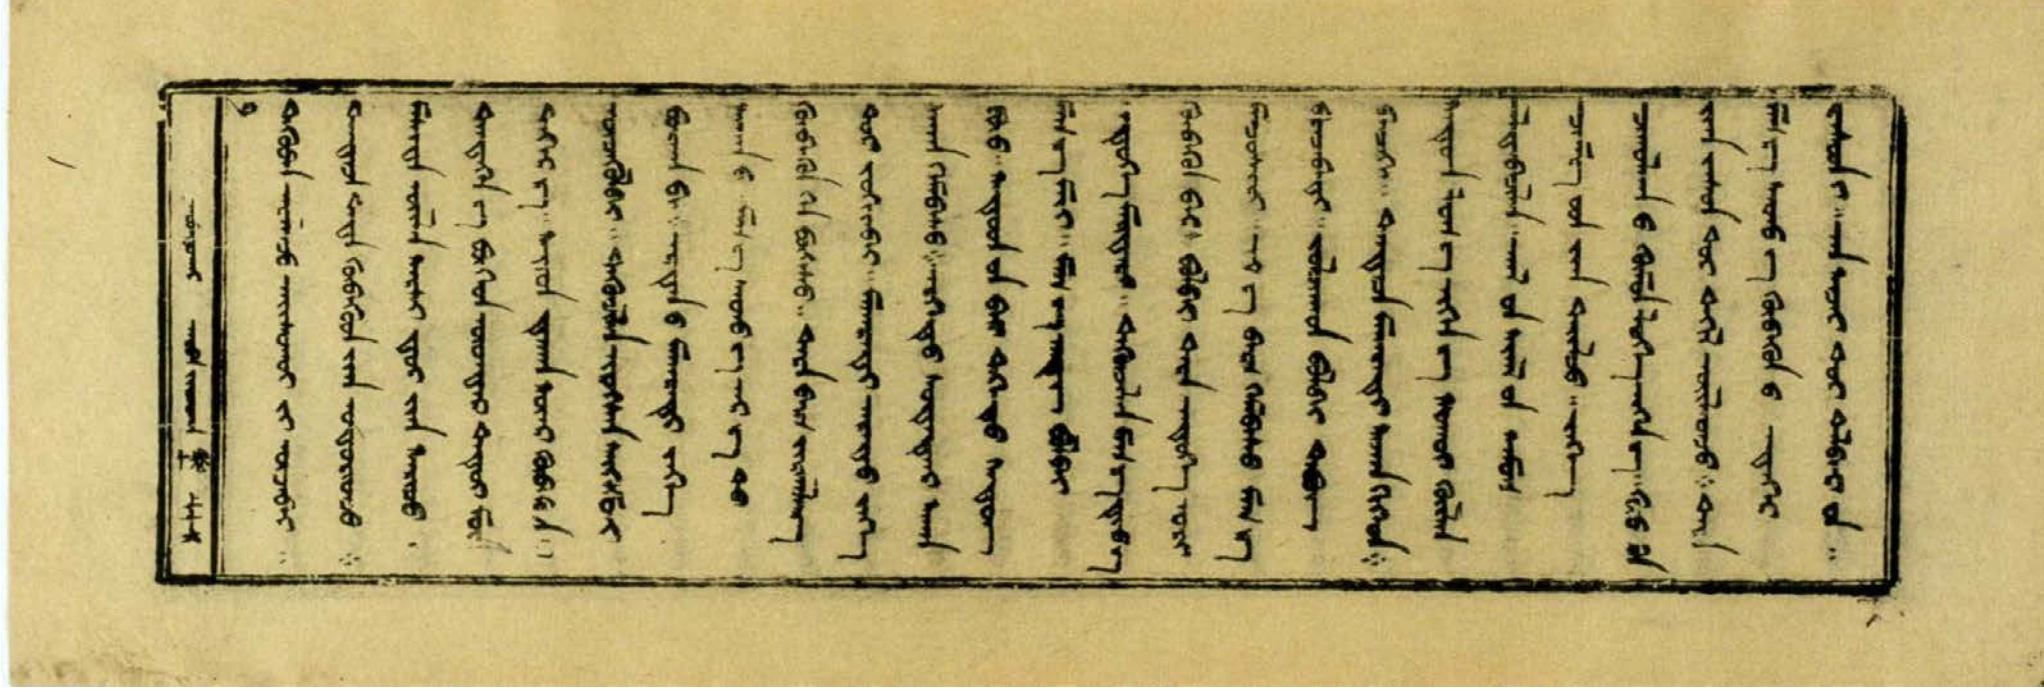

Fig. 2. Inscription No. 25.

'Script' or 'Variant'?: Old Uyghur

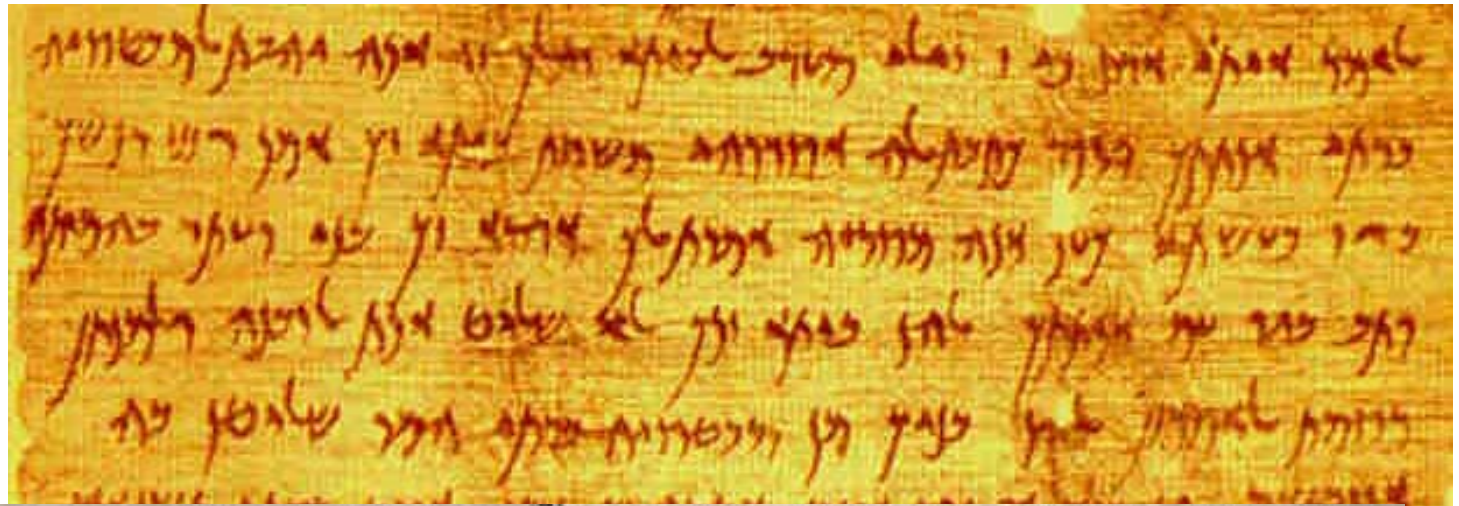

'Script' or 'Variant': Mongolian

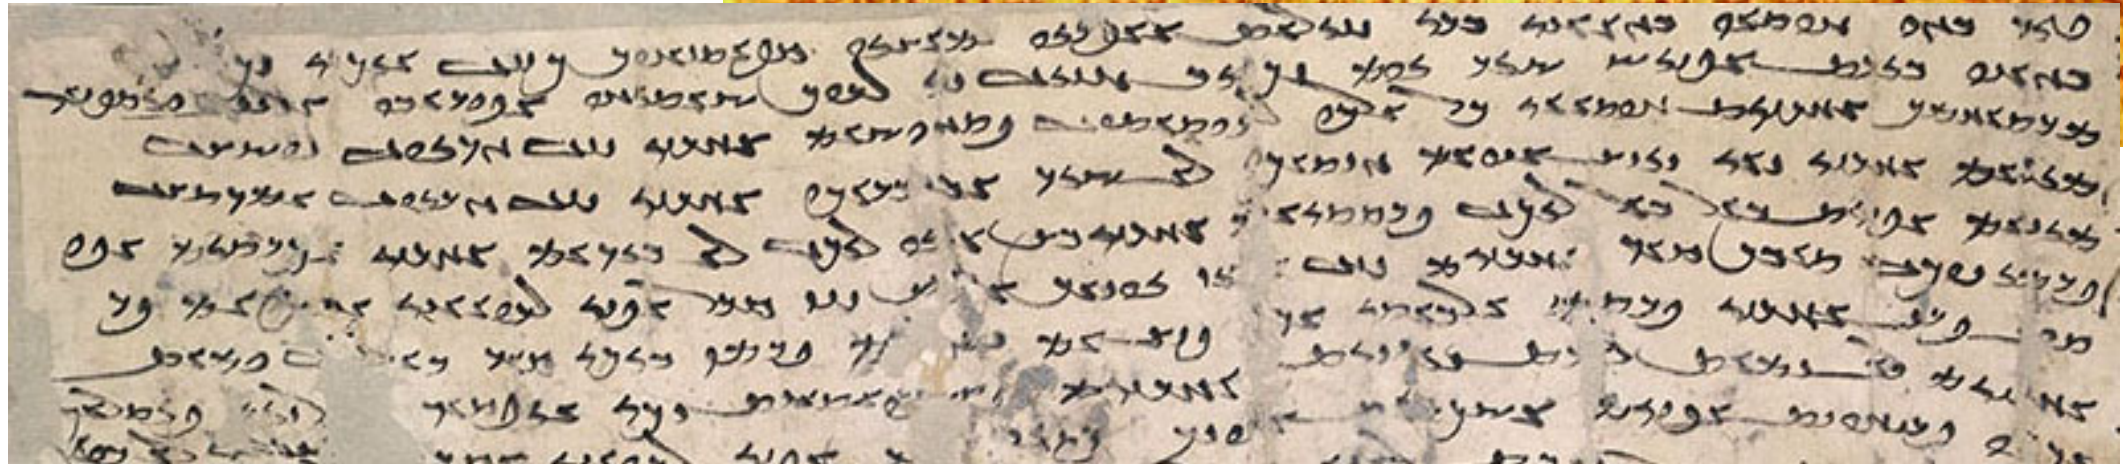

Old Sogdian: How to encode?

- Unification with Aramaic?
 - uses characters / code points from Imperial Aramaic block?
 - Palaeographically valid, but should Sogdian be considered a 'style' of Aramaic?
- Single encoding:
 - same character set for representing different forms of the script
 - usage of fonts to display different script styles?
 - but, which form is to be representative for plain text?
- Separate encoding:
 - two different character sets for historical stages of Sogdian
 - enables both scripts to be displayed simultaneously, without font changes

Aramaic & Old Sogdian

Handwritten text in Old Sogdian script, likely a fragment of a larger document. The script is cursive and written on a yellowish parchment. The text is arranged in five horizontal lines, written from right to left.

Handwritten text in Aramaic script, likely a fragment of a larger document. The script is cursive and written on a light-colored parchment. The text is arranged in approximately ten horizontal lines, written from right to left.

Encoding: Sogdian and Aramaic

- Differences in repertoire: Sogdian
 - *Heth, teth, qoph* dropped
 - *Daleth, ayin, resh* merged
 - Special *ayin* used for salutations, eg. `D 'to'
 - Scribal innovations, eg. tail extensions for final characters
 - Special numerical sign for 100
- Cultural and scribal divergences

Old Sogdian: final letters: *aleph*

Old Sogdian: *ayin*

Handwritten Old Sogdian script on a parchment strip. A red box highlights a specific character on the right side of the top line.

Handwritten Old Sogdian script on a parchment strip. A red box highlights a specific character on the right side of the top line.

Handwritten Old Sogdian script on a parchment strip. A red box highlights a specific character on the right side of the top line.

Conclusions

- Script encoding process
 - not art, not science, but a bit of both
- Skills to encode scripts:
 - interest in writing systems and willingness to learn
 - don't need to be a linguist, typographer, or computer scientist
 - research and analytical skills
 - search, search, and search more, then dig deeper, and follow leads
