# Tai Tham

a "hybrid" script that challenges current encoding models

IUC 39 2015 OCT 26-28 Santa Clara, CA, USA

#### Introductions

Hello!

I'm Patrick Chew, presenting on behalf of two co-authors, Pichai Saengboon and Richard Wordingham, who were unfortunately unable to attend. I take full responsibility for any inaccuracies or mistakes in this presentation.

nb: transcription used in this presentation is based largely on the Library of Congress romanization schema:  $u = uu/\ddot{u}$ ;  $\sigma = \vartheta/\sigma = \vartheta$ ;  $\varepsilon = \varepsilon/\ddot{a}$ , with some other modifications, e.g.  $\varepsilon = \varepsilon$ ,  $\varepsilon = \varepsilon/\ddot{a}$ , etc.

# င်ကြန်င်္ဂြံရာ ငြင်္ဂရန်င်္ဂြံရေ

"If you want to know, ask; If you want to write nicely, practice."

Lư proverb from M(ư)ơng Yong

#### Why?

- Pandey and Anderson (2015-Aug-03)
  - "From Local Script to Global Standard: The Lifecycle of a Script in Unicode"
- present basic information about the Tai Tham script
- explore issues with(in) the current model
- contrast a native font/IME effort
- introduce new findings

#### **Basics**

What is Tai Tham?
Where is Tai Tham used?
Who uses Tai Tham?
When has Tai Tham been used?
How was Tai Tham used?
How is Tai Tham used?

#### What is Tai Tham?

## Tai Tham is

- a descendent of Brahmi and Pallava
- a "complex script"
- a 'recently' Unicode encoded script
  - (Unicode 5.2 = 2009-OCT-01)

	<kh></kh>	<g></g>	<g<sup>fi&gt;</g<sup>	<t></t>
Proto-Sinaitic				× ×
Phoenician	<b>κ</b> / Φ	1		+
Aramaic	P/Y	1		p
Brāhmī	า	٨	lu	٨
Pallava	చ	Ŏ	STI	ð
Tai Tham	a	C	ಬ	တ

#### Where is Tai Tham used? (1/2)

Tai Tham user communities are locus located in:

- Thailand (Northern (Lanna) and Northeast (Isan))
- Laos
- Myanmar (Keng Tung Township, Shan State)
- PR China (Xīshuāngbănnà, Yúnnán Province)

# Where is Tai Tham used? (2/2)

#### Who uses Tai Tham? (1/3)

Tai Tham is used by (a subset of) the communities of the following languages

- Kammuang/Lanna ("Northern Thai") :
- O Khưn:
- Lu :
- Lao :
- Isan ("Northeastern Thai") :

- 6.0m speakers
- 106k speakers
- 551k speakers
  - 3.3m speakers
  - 15m speakers n ⊂ ~25m

#### Who uses Tai Tham? (2/3)

# Linguistic classification (Wikipedia)

- Two distinct branches
  - Lao and Isan
  - Thai, N.Thai (Lanna/Kammưang), Tai Lư, Tai Khưn

#### Who uses Tai Tham? (3/3)

#### For purposes of examining writing systems ...

- Consonant development
  - Std Thai + Lao/Isan
  - Lanna + Khưn/Lư ~ Shan
- Vocalic development
  - Std Thai + Lao/Isan + Lanna
  - Lư/Khưn ~ *Shan*

PSW Tai	Std Thai	Lao / Isan	Lanna	Khun/Lu	Shan	
*k	k.	k.	k.	k	k.	
* <u>k</u> h	k <sup>h</sup>	k <sup>h</sup>	<u>k</u> h~x	<u>k</u> h ~ x	x~ kh	
*x	<u>k</u> h	<u>k</u> h	<u>k</u> h~x	<u>k</u> h ~ x	x~ kh	
*g.	<u>k</u> h	<u>k</u> h	k.	k.	k.	
*gh	<u>k</u> h	<u>k</u> h	<u>k</u> h~x	<u>k</u> h ~ x	x~ kh	
*ğ	<u>k</u> h	<u>k</u> h	<u>k</u> h~x	<u>k</u> h~x	x~k^	
* <u>e</u>	g	g.	g	g~i	g~i	
*ia	ja	ia	ia	g.	g.	
*Q	Q.	9.	Q.	Q~u	Q~u	
*ua	ua	ua	ua	Q.	9.	
*a	σ	σ	σ	o~u	σ~ u	
*wa	<u>ua</u>	va	ua.	σ	σ	
*ai.	ai	ai.	ai.	ai.	ai	
*av	ai	ai	ai	ai	aur	

#### Similarities and differences: Cyrillic

- Одного языка никогда недостаточно
- Однієї мови ніколи не досить
- Един език никога не е достатъчен
- Знати један језик није довољно
  - same script
  - similar languages
  - variation in glyph choices
  - script still behaves consistently

# Similarities and Differences: Tham region

"New Year"	saṅkrānti		
Thai	สงกรานต์		songkran
		ສິງກນ	
Lao	nලිුුුුුුුුු	గ్రాణ్మా	songkān
Lanna	න්[්කලූ	သည် <u>ဒ</u> ်	sangkhān
Khưn		သ်ံရ၁ု	sangkhān
Lư		သ်ံရ၁္စ	sangkhān

#### When has Tai Tham been used?

- c. 1300-present
  - o 1262-1775 CE Lanna Kingdom
  - 1277 written transcription of sutras in Sipsongpanna
  - 1376 oldest dated Lanna Tham inscription (Ongsakul 2001)
  - 1451 Lanna missionary activity to Keng Tung
  - 1465 oldest Tham writing of Lanna Thai and Pali (Hartmann 1986)
  - 1471 oldest Lanna palm leaf manuscript (Penth 2000)
  - 1548 Lanxang (Laos) and Lanna unite
  - 1559 Burmese suzerainty over Kengtung
  - 1560 Tham script inscription in Lanxang (Hartmann 1986)
  - 1600s use of Tham in Isan

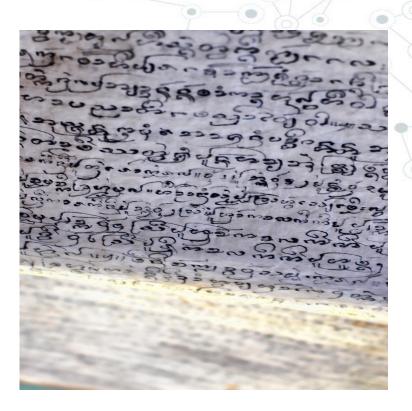

#### How was Tai Tham used?

- Primarily as a liturgical script
  - Tham ('scripture' < P. dhamma / S. dharma)</p>
  - ocontrasted with the Fak Kham and Nithet scripts
  - written on palm leaves (bai-lan) or sa (mulberry) paper
- Also secularly used
  - historical chronicles,
  - legal / astrological /medicinal treatises
  - o poetry, etc.

# Palm leaf (*bai-lan*) manuscript [Tham Lao]

Sa (mulberry) paper manuscript [Tham Lanna]

#### How is Tai Tham used?

- Remains liturgical in Laos
- Coexists with
  - national Thai as a regional / identity script in N/NE Thailand
  - national Chinese & officially-reformed New Tai Lue script as an identity script
  - <u>national Burmese</u> and <u>regional Shan</u> as a regional / identity script (daily use)
- Online use
  - websites
  - music video subtitling

#### How is Tai Tham used?

#### How is Tai Tham used?

#### **Basic features**

- Tai Tham as a Brahmic/Indic script
  - abugida
  - independent vowels
  - conjuncts + overt vowel-killer
- Baseline
- Glyphs

#### Tai Tham as a Brahmic script

# abugida

consonants have a default /a/ vowel

ന	ವ	(S)	S	6	<sub>sm</sub>	ري د
<ka></ka>	<kha></kha>	<xa></xa>	<ga></ga>	<ğa>	<gha></gha>	<ŋa>
ව	ಖ		জ	(R)	ଶ୍ର	ນ
<ca></ca>	<cha></cha>		<ja></ja>	<za></za>	<jha></jha>	<ńa>

- other vowels override default vowel
- vowel positioning all over (not strictly linear like Latn)
- independent vowels
- o conjuncts + overt vowel-killer

#### Tai Tham as a Brahmic script

- abugida
  - consonants have a default /a/ vowel
  - other vowels override default vowel

ka + ā = kā	က	3	നാ
ca + I = ci	ຄ	ြ	ည
ta + u = tu	တ	_	တ်
ba + ǫ = bǫ	υ	°	ပ္ငံ

- vowel positioning all over (not strictly linear like Latn)
- independent vowels
- oconjuncts + overt vowel-killer

#### Tai Tham as a "complex" Brahmic script

# abugida

- consonants have a default /a/ vowel
- other vowels override default vowel
- vowel positioning all over (not strictly linear like Latn)
  - unlike most other Indic scripts, Tham can have a complex vowel completely surrounding the consonant ([?ə?])

### Tai Tham as a "complex" script

- abugida
- independent vowels

	а	ā	İ	Ī	u	ū	ē	ō
Lanna	අ	ଷ୍ଟେଠ	SS	ට්	ຄ	(ه)	س	ESS
trad. Lư	n	ಖಂ	ದ್ದ	S)	5	(V)	0	જી
cont. Lu / Khu	သ	သ၁	93	(Egg	9	9	9	[သ
Lao/ Isan	ຖ	සා	ರಿ	ପ୍ତି	ଚ	ତ୍	9	ර්

## Tai Tham as a "complex" Brahmic script

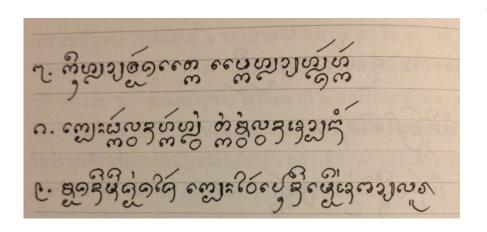

- abugida
- independent vowels
- conjuncts + overtvowel-killer

	'elephant'	'fragrant'	teachings; dharma	'dharma'
	cāŋ	hǫm	thamma	t <sup>h</sup> am
Lanna	हुन्दु हुन्दु	బ్బ్	<b>ဂ်</b> မ	<u> </u>
trad. Lu	á2	సొద	<b>င်</b> မွ	රල්
cont. Lư / Khưn	డ్వ	လို့ရ	<u> </u> င်မွ	<mark>်</mark> ဝဋ်
Lao/ Isan	ద్దన	<b>ന്ദീ</b>	ର୍ଷ୍ଟ	
	jā ŋ	h m Q	a d <sup>fi</sup> m ma	a × d <sup>fi</sup> m m(a)

#### Baseline

Tai Tham has a "hanging" baseline

Bottom Middle Alphabetic Hanging

#### Tai Tham glyph exemplars

- Lanna is the most 'complex'
  - open entries, high degree of swash, folded finals
- Isan/Lao
  - open entries, reduced swash, reduced folding in finals
- tr. Lư
  - reduced entries, moderate swash, negligible finals
- c. Lu/Khun
  - simplified entries, negligible swash, simplified finals; 'sans serif'

	Lanna	නැති තරා සැරු සාට යාරම් ස්ධාාරුම් යාරම් සඳුකා යාරම් තමු සරිදේ අමුහලම්
Thom	Lao/Isaan

#### Diller 1988

[3] Script relationships suggested by presently-know dated texts

#### Tai Tham problematic points (?)

- ā vs tall-ā
- n ~ n ('ng')
- "conjoined" consonants
- medials
  - atomic encoding
- vowel representation
  - o consonant? or vowel?
- Oplacement of marks
- o "aesthetics" and regional preferences

#### Tai Tham ā and tall-ā (1/2) - "default"

#### default rule:

tall-ā follows certain letters to avoid potential ambiguity

	[g]	[b]	[d]	[dh]	[w]			
disambiguating form	ച	<u>a</u>	<u>a</u>	ඛ	a			
potentially ambiguous form	ဂာ	භ	೦೨					
ook-alike	က	ಬ		တ				
	[k]	[h]		[t]				

conforms to standard Mon/Bamar orthographic rules

#### Tai Tham ā and tall-ā (2/2) - "exceptions"

- Myanmar encodes ā and tall-ā separately
  - Mon / Bamar show complementary distribution
    - S'gaw Karen only uses the tall-ā
- Tai Tham encodes the two separately
  - U+1A63 □ ; U+1A64 □
  - despite normative complementary distribution, exceptions are found
  - tall-ā follows other letters where potential ambiguity is not expected
  - found primarily in Lanna palm-leaf manuscripts

<ü>>	ദാ	ດດວ	ഹി
<s></s>	ಖ	ນາ	வ
<ss></ss>	ລວວ	ໝາວ	ည်

Tai Tham -ŋ/m : nga vs mai-kang / mai-kang-lai

- native
- O Pali:
  - mai-kang (niggahit)
  - mai-kang-lai ("flowing mai-kang")
- vis-à-vis Myanmar kinzi

#### Tai Tham -ŋ/m : nga vs mai-kang / mai-kang-lai

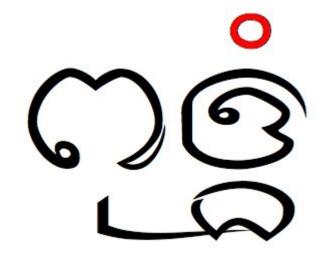

- native/nativized vocabulary :
  - <jāŋ> » [tcaːŋ] 'elephant'
  - U+1A29 U+1A76 U+1A63 <mark>U+1A60 U+1A26</mark>
  - LOW CA TONE-2 AA SAKOT NGA

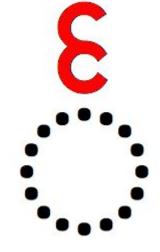

- Pali: mai-kang-lai ("flowing mai-kang")
  - Pali spelling (word-internal) : <saṅgĥa> » [saŋkʰaʔ]
  - U+1A48 U+1A58 U+1A25
  - SA
     MAI KANG LAI LOW\_KHA

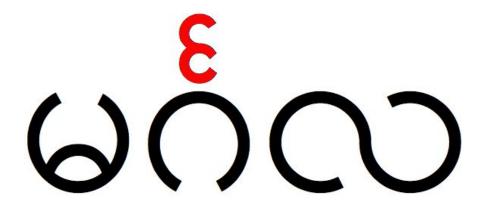

Pali spelling (form inflection): <budd<sup>6</sup>am̄> » [putt<sup>6</sup>aŋ]
 U+1A3B U+1A69 U+1A34 U+1A60 U+1A35 U+1A74
 LOW PA U LOW TA SAKOT LOW THA MAI KANG

- vis-à-vis Myanmar kinzi
  - Myanmar kinzi specific rendering
  - NGA ASAT VIRAMA
  - U+1004 U+103A U+1039

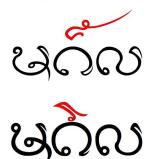

- vis-à-vis Myanmar kinzi
  - o MA NGA ASAT VIRAMA GA LA
  - U+1019 U+1004 U+103A U+1039 U+1002 U+101C

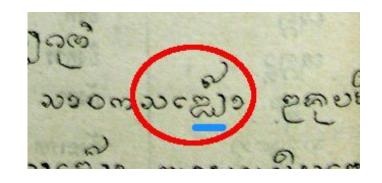

theoretically feasible to force MAI KANG LAI to behave like a kinzi, where overt vowel killer and virama are used in combination

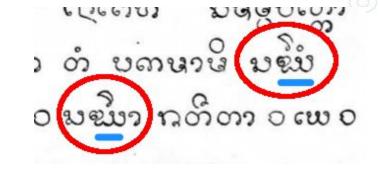

BUT - NGA+RA HAAM+SAKOT is a permissible sequence that would
 not produce the desired affect

position: default = over following consonant

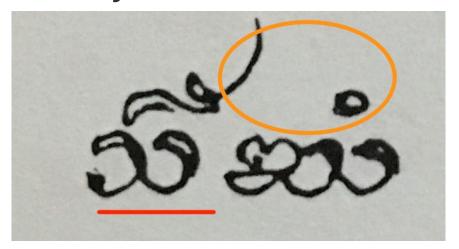

Lanna example

Lao example

## position: conditionally shifted

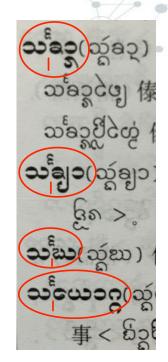

Lanna example (Chalieo Munchan 1983)

## position: between

modern typeset Lu/Khun prefers medial placement

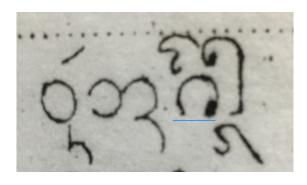

Khun example (Peltier 1996)

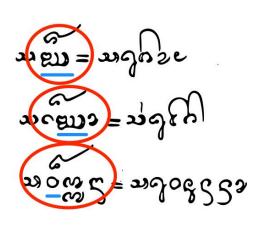

Lư example (西双版纳傣族自治州 2002)

# position: Lu/Khun counter-example

older handwritten Lu/Khun use the default

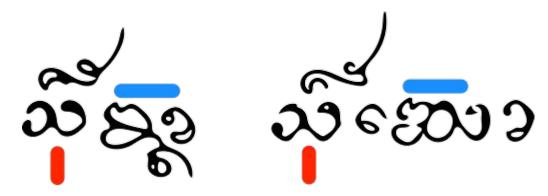

Khun example (1949)

Lu example (刀新华 1989)

position: completely un-shifted

Lanna example (Chalieo Munchan 1983)

## positioning

- traditional / handwritten varieties default to placement over the following consonant
  - conditionally offset
- modern typeset Lu/Khun prefers medial placing
- Theppitak K. presents Lao examples that do not display offsetting
  - Lao/Isan font spacing is deeper

### Final consonants and syllabicity

- Myanmar model always overtly marks
  - asat OR subjoined consonant

- Khmer model rarely marks
  - subjoined consonants in medial position
  - rare to use the tondakiat
  - otherwise unmarked (like Thai/Lao)

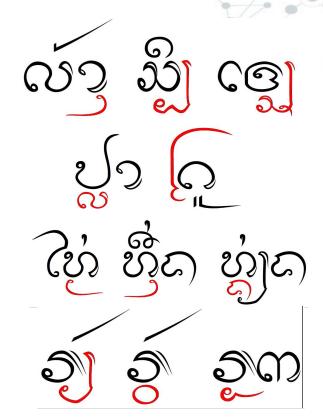

## Tai Tham innovations, re: syllabicity

# status quo stacking

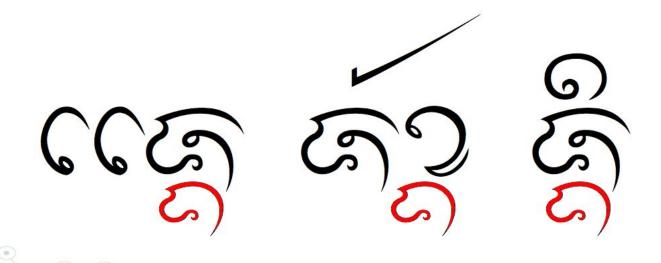

When Tham consonants are written as subscripts

- final consonant of a syllable
- initial consonant cluster medial
- combined with <h>
- consonant symbol represents a vowel

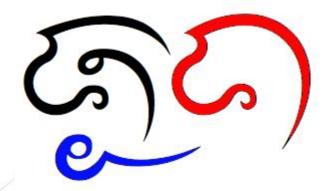

$$\circ$$
 y (= ia), w (= ua), ? (=  $\varrho$ )

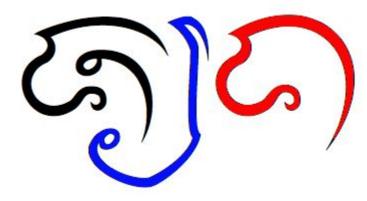

default positioning is below (subjoined)

 in the case of other characters below (vowels, clusters, medials) positioning below is blocked and spelling requires 'baseline' position

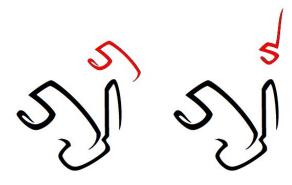

- with <ia>, Lu/Khun traditionally raise the final
- primarily -ng, -n (<r>), -w

- raised final <r> visually looks like TAI THAM SIGN RA HAAM (U+1A7A)
- traditionally size has differentiated, but graphic variations also have been used to disambiguate

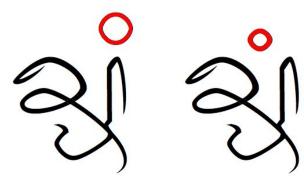

Lu/Khun examples raised -r ≠ rahaam

Lanna examples raised -r ≠ rahaam

- raised final <w> visually looks like TAI THAM SIGN MAI KANG (U+1A74)
- size usually is the differentiating factor\*

Lu/Khun examples raised -w ≠ maikang

- Tham Lao/Isan add further confusion to the mix
  - depending on the vowel
    - some consonants (-p, -t, -k, -m, -w) behave as expected:
       subjoined raise to baseline
    - -ng requires either subjoined OR raised
      - raised final NGA and MAI KANG LAI are conflated
    - some consonants (-y) always require subjoined forms
    - some consonants (-n) require subjoined depending on the vowel

Tham Lao/Isan -ng

### Tai Tham vowels - conditioned allomorphy

# open vs closed syllabl

○ khǭ ≠ khǭng

hua ≠ huan

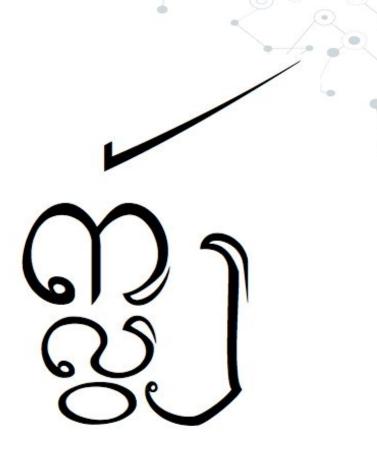

#### Final consonants and syllabicity

- Myanmar model always overtly marks
  - asat OR subjoined consonant
- Khmer model rarely marks
  - subjoined consonants in medial position
  - rare to use the tondakiat
  - otherwise unmarked
- Tai Tham model
  - use of rahaam is rare and sporadic (unmarked)
  - visual cues include
    - positional shifts
      - vowel composition

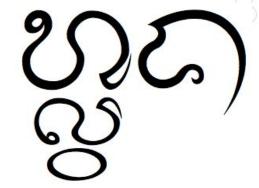

## Orthography clashes

- $\bigcirc$  maximal = 3 (?)
- Subjoined stacks ≤ 3
  - < <kluay>

## Orthography clashes

- usually stacks are two deep<hluang>
- to mitigate illegibility, lowest stack moves

## Orthography clashes

- Tai Tham KH font auto shifts lowermost stack (and changes shape)
  - logical ordering, exceptional placement
- logical ordering, but not logical semantics also occur

### Two current Tham approaches

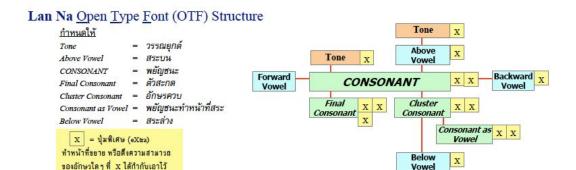

- LN Tilok/Monsaen
  - legacy as-yet-converted to Unicode
  - Lanna-style

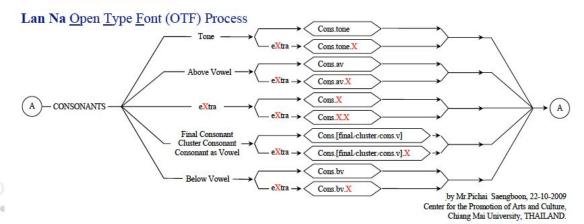

- Tai Tham KH
  - Unicode implementation
  - Khun-style (Lu, by extension)

#### LN Tilok / Monsaen

- pre-Unicode/legacy efforts ("hack")
  - LN Tilok = Lanna-style
  - LN Monsaen = traditional Lu-style
- based on Thai (Kedmanee)
  - intent to facilitate ease in transliterated entry using Thai spelling
- combines OTF features + inputbecomes a basic IME

#### LN Tilok / Monsaen

#### LN Tilok / Monsaen

- based on Thai (Kedmanee)
- allows for ease of typing from Thai into Tham
- codepoints used were the fuller Thai inventory, the font allowed for visually homographic codepoints

5	20	TV		2000				
k	ก	ണ	₫	ฎ	N	đ	ด	M

ğ	ค	3	фh	<b>M</b>	ಖ	dh	ឥ	೧
gh	ฆ	ಖು	ņ	ณ	ഓ	n	น	2
ng	9	S						

## LN Tilok (paiyannoi)

- Standard Thai does not stack or ligate
- "variation selector" built in
  - use the lesser-used paiyannoi (૧) to choose variants (up to three layers)
    - positional
    - glyph choice(s)

## LN Tilok (paiyannoi)

- 1st layer of variation = subjoined
- 2d-3d layer of variation = glyph and positional variants
  - substitutions for spacing
  - regional variations
- n.b. <r> doesn't show the rmedial; it occurs only in certain combinations

			LN Tilok

LOW PA (U+1A5A)	С	C	พๆๆๆ	SIGN OY (U+1A6D)	E	A-0.000	

 unlike other Indic scripts (e.g. Malayalam chillaksharam), Tham users mentally associate variants with the original "Aesthetics" vs ordering

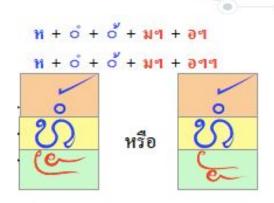

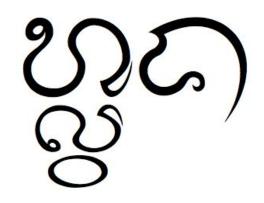

- Tham re-orders glyphs "aethetically" at the writer's discretion
- semantically they are identical
  - consonant cluster (HA + SAKOT + MA)
  - two-part vowel (MAI KANG + OA BELOW)
  - tone (TONE-2)
  - adjusting to visually allow for both results in divergent semantic analysis

## "Aesthetics" vs ordering

- LN Tilok begins visually
  - ordering of the upper elements
  - HA + MAI KANG + TONE-2
- last two elements are ordered semantically identical, but 'variation' selection adjusts
  - MA (subscripted) + A (subscripted + adjusted)

## "Aesthetics" vs ordering

# LN fonting insights

- current Unicode encoding encodes separate codepoints for positional variants
- LN Tilok glyph choices based on semantic relatedness from most expected to lesser expected <u>within the same</u> <u>font/system</u>
  - Lanna-centric; LN Monsaen somewhat addresses
     Lư/Khưn preferences, but is not comprehensive
     extremely visually-based

- http://www.kengtung.org
- iOS implementation (font + keyboard)
- full (?) repertoire of current Unicode Tai Tham block
- Khun-centric (by extension, Lu)

ဂဎ္စလဎဗ္ဗိ လေ၁ဗိါ သင္စ္ကန္တာ၁ လေ၁ဗိါ ဘ်မ္အ သထိင္ ဘဖေိ ဘထိ၁ သဝေဎ၁ လေ၁ဗိါ သပါ၁မပိါ၁

base layer = most frequent (?)

shift = less common (?)

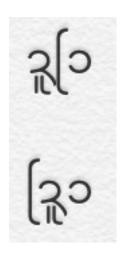

3d layer = numbers, symbols, punctuation

U+1A4B U+1A20 U+1A60 U+1A21 U+1A41 || U+1A34 U+1A71 || U+1A35 U+1A62 U+1A3E U+1A60 U+1A3E U+1A7C || U+1A21 U+1A60 U+1A3F U+1A7A || U+1A2F U+1A71 U+1A62 || U+1A37 U+1A73 U+1A75

- handwritten Lu and Khun simplify the strokes in a TONE-2 (U+1A76) to look like that of a MAI SAT (U+1A62)
  - Tai Tham KH keyboard has TONE-2 in the 3d layer and is overlooked in visual representation
- LUE KARAN and raised final RA contrast
  - visually homographic; semantically mismatched

U+1A2F U+1A6A U+1A55 U+1A63

logical ordering (d ū r ā) yields incorrect rendering

U+1A2F U+1A55 U+1A6A U+1A63

 entry according to visual rendering required to achieve desired rendering

# rishida on tyopgraphy

"An ordinary web author who is trying to add [tatweels] to manually justify the text may not know how to apply these rules."

 Tham users are digitizing according to what is visually familiar, despite mismatches in expectations from encoding

### Current issues

- "abbreviations"
- TAI THAM CONSONANT SIGN LA TANG LAI (U+1A57)
- TAI THAM CONSONANT SIGN HIGH RATHA OR LOW PA (U+1A5B)
- TAI THAM SIGN MAI SAM (U+1A7B)

# "Abbreviations"

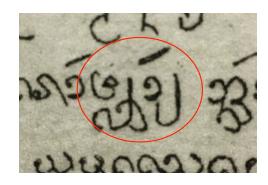

Ġ	<b>దీ</b> టి	kọ đọ	'also not have'
විය	<b>්</b> ටි	kǫ wā	'also say(s)'
<u>ජ</u> ්ත	ථ්පා	bọ mā	'to not come'
වු	ಲೆಡಿ	bo mī	ibid.
స్ట	<i>්</i> පී	bo mī	'to not have'
ર્જીંગ	ર્યક્ર	pai mā	'comings and goings'

## **TANGLAI**

- <tanglai> used as a plural marker, usually abbreviated
- TAI THAM CONSONANT SIGN LA TANG LAI (U+1A57)
  - partial abbreviation atomically encoded
  - only Lu and Khun show this form

## **TANGLAI**

Lao example shows abbreviation process

Lanna shows multiple variations

# "Abbreviations" (inclusive of TANGLAI)

# questions:

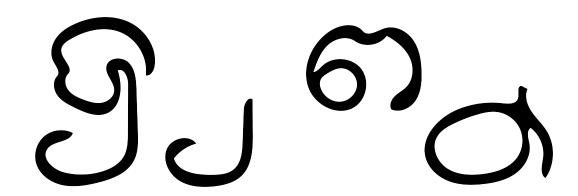

- are the inventories regional or universal?
- visual input expectation vs logical input expectation?
- ontrast with Latin: & (et) % (per cent); ibid. etc.
- handled by font? » rendering engine needs?
- o dictionary? » decomposability?

U+1A5B = subjoined HIGH RATHA (th) | subjoined LOW PA (b)

 Lanna and documents and fonts (inclusive of Khun) indicate non-distinct homography

- Lanna / Khưn: subjoined ṭha = subjoined ba
- O Lu / Lao / Isan : subjoined tha ≠ subjoined ba

Lao example of graphic distinction (Luang Mahasena Phui, 1951)

- Lanna / Khưnsubjoined tha = subjoined ba
- Lư / Lao / Isansubjoined ṭha ≠ subjoined ba

Isan example of graphic distinction (Sawing Bunčhom, 2009)

- Lanna / Khưn : subjoined ṭha = subjoined ba
   Lư / Lao / Isan : subjoined ṭha ≠ subjoined ba
  - 2- wsderwardene 2- wsderwardene 3- wsderwardene 3- wsderwardene 3- wsderwardene 3- msdess 3-

Lu example of graphic distinction (刀新华, 1989)

Lu example of graphic distinction (Khotsimeuang, 2001)

- Tham
  - Lanna / Khưn : subjoined tha = subjoined ba
  - Lu' / Lao / Isan : subjoined tha ≠ subjoined ba
- Myanmar
  - homographic subjoined consonants not documented (yet?)
- Khmer
  - subjoined ta = subjoined ta

glyphs	codepoints	unicode names	
ង្គ	178A 17D2 178A	da coeng da	
ត្ត	178F 17D2 178F	ta coeng ta	

# Lek-tho/Mai-sam (U+1A7B): a scoped relationship

Unicode Standard documented three cases

- repetition mark for the whole of a word
- disambiguate function of a subjoined letter
- "double-acting" consonants

One other also exists

indicates a long-a is present

# Lek-tho/Mai-sam (U+1A7B): a scoped relationship

වූ	(පූ) = පූ පූ	khǫy khǫy	'gradually, little by little'
යනිදව	න () ແරි	să-wæng (*swæng)	'to pursue, seek for'
ම්දු	<sup>ශ</sup> (ප) ූ	mī māk	'to have a lot'
ට ගුදු	ට ට	tanhā	'loneliness'

# As yet documented for handling

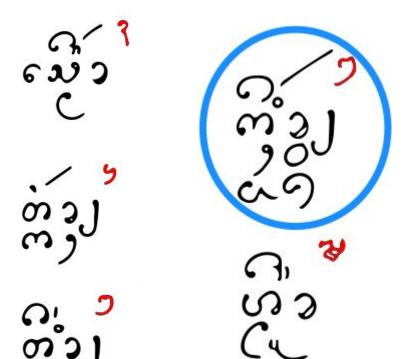

- use of other numbers
- hāng-læm "tail" letters
- other vowel forms
- o akkhara piset

## More than MAI-SAM/LEK-THO

○ numbers other than "2" (□) are used for abbreviation notation

- o numbers "3" ( $\square$ ), "4" ( $\square$ ), "5" ( $\square$ ), and "8" ( $\square$ ) are attested
  - these indicate how many words are contained in a compact 'abbreviation'

## More than MAI-SAM/LEK-THO

 $k\bar{a}$  kin kluay klāng  $k\bar{o}$  = the crow eats bananas in the middle of the grove

 as with the vowel-killing ra-haam, these are optional, c.f. graphic on title page

# "long tail" variants

- Myanmar/Khmer models diverge
- Tham incorporates both

Padauk	Lucida Sans	Tai Tham KH	LN <sup>-</sup>	Tilok
ಬ್ಬು	ឃ្ឃ	ಬ್ಬು	SN SN	sin
S	ប្ប	ည	ပ္ပ	ا ا
သ္သ	क्रि	ඉත	රු	ପ୍ତ

# "long tail" variants

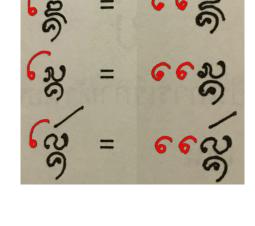

- "long tail" in higher frequency on particular letters
- some claim only "aesthetics"
- some claim there is semantic difference
  - "long-tail" indicates a syllable initial

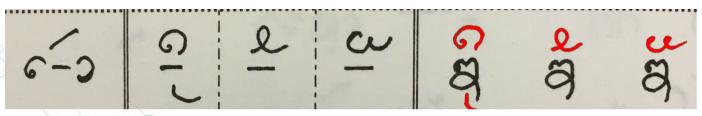

ಬ್ಬ	plā	'fish'
တ္သည္ဆ	talāt	'market'

# New vowel forms (?)

a full-sized '2' represents the long-æ vowel

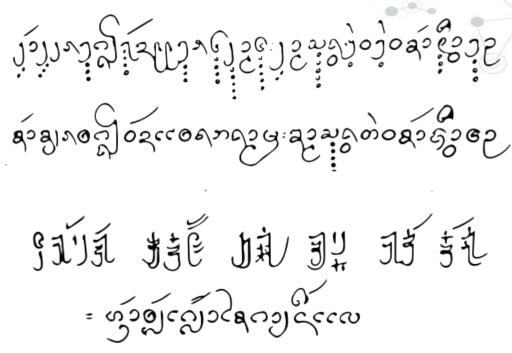

- new representations for /au/
  - /i/+/u/
  - TAI THAM VOWEL SIGN OA ABOVE (U+1A73)
  - 'subscript-qa' above for /au/

# "Akkhara piset" (special characters)

- some are visually derivable; some are not
- cryptogrammic equivalents for default glyphs
  - "U+1A7F tai tham combining cryptogrammic dot is used singly or multiply beneath letters to give each letter a different value according to some hidden agreement between reader and writer."
  - variation in directionality in layout

## Summary 1/2

- Tai Tham
  - exhibits similarities with neighboring writing systems, as expected of related scripts, but shows "hybrid" nature exhibiting features found in one or another or incorporating multiple
  - shows extreme variance that confounds contemporary programming efforts
  - despite relatively uniform behavior, regional differences manifest in a number of ways
  - more content and data indicate that there's much more to investigate

## Summary 2/2

# high-level topics

- user experience; actual use; flow
- interoperability
- storage, parsing, normalization
- orthography; lexicography; fonting
- standardization
